# the new standard in security

IT'S ABOUT THINKING AHEAD.  
AND ACTING NOW.

In today's safety and security environment, chemical plants, oil refineries, liquid or natural gas distributors, pulp/paper mills, and food, beverage, and pharmaceutical plants are all potential targets. That's why Honeywell is working hard to help industrial operations maintain the highest levels of security and safety.

A trusted name in security and process management for more than half a century, Honeywell is setting a new industrial standard based on integration and efficiency.

Most security plans operate in a vacuum, producing streams of data that are never cross-referenced or acted upon. Honeywell connects process control with physical security, so you get a unified system that translates mountains of raw data into actionable information. By uniting your people, processes, assets, and overall business, Honeywell delivers tightened, reliable security that enhances productivity rather than hindering it.

## See beyond your perimeter.

The most obvious ways to protect your facility are physical: fences, barricades, and guards. But these safeguards provide only one layer. So Honeywell goes many steps further, delivering a four-tiered approach that includes physical, electronic, cyber, and integration layers.

Our electronic layer includes technology such as wireless and microwave closed-circuit TV to show what's going on within your facility and beyond the perimeter. Our cyber layer protects your network and systems. And our integration layer—the highest level of security—ties everything together. So you can detect suspicious activity and make intelligent decisions to prevent intrusions or attacks.

## Know when to take action.

To maintain high levels of productivity and efficiency, it's important to remember that potential threats are just that: potential. So Honeywell provides technologies that enable you to make intelligent decisions and take action when necessary.

Our fence sensor technology, for example, differentiates between a rabbit, a human, or wind. Video cameras zoom in on potential threats and determine whether an operator should be notified or whether other precautions are necessary. Access control systems track everyone who comes and goes from your facility and where they are located while on the premises. By distinguishing between real threats and false alarms, you can mitigate risk and dramatically accelerate response time for greater security and plant safety.

In the event of an emergency, our ExitPoint™ audible exit signs can reduce evacuation times by up to 75 percent, using directional sound technology to clearly communicate exit and escape routes, especially when visibility is impaired. And our Mustering Solution extends your Access Control System to automatically identify where individuals are, while accounting for anyone in the "Hot Zone," so you can direct response teams most effectively.

## Protect the heart of your operation.

As remote access to operations increase, control room protection must combine physical deterrence with sophisticated IT and cyber security. Honeywell excels in both, with specialized services that prevent virtual security breaches and advanced materials—like bullet-resistant Spectra® fiber for vests and doors and Lumilux® glow-in-the-dark paint—that physically protect your control room.

## Bring it all together.

Honeywell provides multiple integration platforms that bring together information from across your operations and can help you meet your specific needs. These platforms provide unified interfaces that enable you to manage security, visitors, plant information, life safety, and HVAC controls—which results in increased security and optimized productivity. Thanks to Honeywell's resources, and by working with our channel partners, we provide the best integrated solutions for a variety of industrial settings.

Unlike proprietary systems that are difficult to scale and integrate, Honeywell solutions are based on an open, collaborative architecture that protects your plant, your people, and your business. Very few, if any, other companies can promise that on such a large scale. Which is why, after more than 50 years, Honeywell is still a global leader in security and process management.
